New Zealand Society of Animal Production online archive

This paper is from the New Zealand Society for Animal Production online archive. NZSAP holds a regular annual conference in June or July each year for the presentation of technical and applied topics in animal production. NZSAP plays an important role as a forum fostering research in all areas of animal production including production systems, nutrition, meat science, animal welfare, wool science, animal breeding and genetics.

An invitation is extended to all those involved in the field of animal production to apply for membership of the New Zealand Society of Animal Production at our website www.nzsap.org.nz

The New Zealand Society of Animal Production in publishing the conference proceedings is engaged in disseminating information, not rendering professional advice or services. The views expressed herein do not necessarily represent the views of the New Zealand Society of Animal Production and the New Zealand Society of Animal Production expressly disclaims any form of liability with respect to anything done or omitted to be done in reliance upon the contents of these proceedings.

Erratum:

In the original printed version of this paper, incorrect labelling of some of the axes occurred in two of the figures. Corrected versions are shown below. The authors regret this error.

FIGURE 2: Plots of the relationships between the pH, titratable alkalinity and potassium ion concentration of the water soluble extract of greasy fleece samples, and measurements of the tristimulus (Y-Z) values before and after the fleece samples were incubated. The fine lines indicate the 83% confidence band for each relationship. B = Romney back, M = Romney midside, L = Romney belly, b = Merino back, m = Merino midside, l = Merino belly.

FIGURE 4: Plots of the relationships between individual sheep estimates of the rates of skin gland secretion, titratable alkalinity and potassium ions secreted during three of the environmental challenges, and measurements of the tristimulus (Y-Z) values before and after the fleece samples were incubated. The fine lines indicate the 83% confidence band for each relationship.
